

## Changes and challenges:

- Originally, the slider was going to be the plain image on the background. After much debilitating, I decided to give it parallax scrolling.
- I found the lack of empty spaces in the various sections to be a tad bland and overwhelming for my eyes, so I chose to broaden it out past the original gridline in the Photoshop document.
- I used a monochromatic colour scheme with the blue of the navigation and footer ([#B0D3E0](#)) as well as contrasting colours for a few of the section components.
- The rectangle borders were removed, as the original borders gave issue with the width (not thickness, the lateral distance from one point to the next).
- The mobile responsiveness and JavaScript didn't function as desired, resulting in it being best in landscape view. Personally, I have no issue with it as I prefer using landscape for when I'm scrolling the web on my phone.
- Font sizes that were specified in the wireframe had to be changed, as the Photoshop document had been done in 300ppi as opposed to 72ppi, which is used for the web.
